

Parker Pizza: B2B CRM Implementation

A comprehensive RevOps and Sales Cloud solution architected to transition a food brand from direct-to-consumer operations to multi-tier regional grocery distribution.

1. Executive Summary & Business Context

Parker Pizza initiated a strategic expansion to place its frozen gourmet pizza products onto regional grocery store shelves. Unlike direct-to-consumer retail, B2B grocery distribution requires managing protracted sales cycles, negotiating margin agreements, coordinating sampling presentations, and delivering post-signing merchandising collateral.

MIGRATION

Identified Pain Points

- **Fragmented Accounts:** Store branch locations and procurement buyer histories were tracked across spreadsheets without relationship hierarchies.
- **Multi-Stakeholder Friction:** B2B grocery deals required consensus across Category Managers, Store Directors, and Merchandisers.

Solution Objectives

- **Unified 360° Data Model:** Model store accounts, purchasing contacts, and marketing assets within native Salesforce objects.
- **Standardized Sales Lifecycle:** Deploy a guided 5-stage opportunity pipeline with validation rules and key field prompts.

- **Disconnected Hand-offs:** Point-of-Sale (POS) sampling logistics had zero automated trigger upon contract finalization.
- **Pipeline Blindspots:** Leadership lacked unified visibility into projected wholesale revenues and stage-by-stage deal velocity.

- **Automated Revenue Operations:** Deploy Flows for opportunity naming standards, executive margin alerts, and task generation.
- **Role-Based Governance:** Implement granular profiles, permission sets, and field-level security reflecting enterprise standards.

2. Business Process to Salesforce Architecture Mapping

To eliminate operational overhead while keeping the system straightforward and maintainable for sales reps, the business distribution model was mapped directly into Salesforce Sales Cloud objects:

B2B BUSINESS PROCESS STEP	SALESFORCE OBJECT	TECHNICAL CONFIGURATION & BUSINESS VALUE
1. Identify Target Stores Research potential retail chains & regional supermarket locations	Account (Standard)	Structured parent-child Account hierarchies to distinguish corporate supermarket headquarters from individual branch delivery addresses.
2. Initiate Sales Outreach Cold outreach to procurement buyers & category managers	Lead & Contact	Standardized qualification statuses and conversion mapping. Converts qualified retail leads directly into Contacts linked to target Store Accounts.
3. Conduct Presentations In-person product tastings and shelf-space pitch decks	Opportunity (Stages 1–3)	Configured Sales Path with custom fields capturing "Tasting Approval Status", "Proposed Margin %", and competitor displacement notes.
4. Negotiate Terms Pricing tiers, delivery frequency, and slotting fee terms	Opportunity & Products	Utilized standardized Products and Price Books for wholesale frozen SKUs. Enforced validation rules on minimum wholesale order quantities.
5. Finalize Contracts Securing executed legal distribution agreements	Opportunity (Closed Won)	Record-triggered Flow automatically updates Account status to "Active Distribution Partner" and locks contract pricing details.
6. Launch In-Store Support Shipping POS banners, sample freezers, and coupon kits	Campaign / Custom Object	Created custom marketing tracking within Salesforce to assign and monitor in-store promotional kits, ensuring seamless handoffs.

3. Relational Data Model & Schema Design

The schema was built to support complex retail grocery dynamics while avoiding unnecessary technical overhead. Ten custom objects and fields were implemented to balance referential integrity and reporting agility.

Schema Builder: Object Relationships & Junctions

DATA INTEGRITY MODEL

Architectural Decisions

Rather than storing retail branch data flatly, relationships were designed for long-term scalability:

- **Account Hierarchy:** Supermarket chains (e.g., Salling Group, Coop) configured as parent accounts with child accounts representing individual retail locations.
- **Lookup Relationships:** Connected wholesale delivery points and distributor brokers to Opportunities without cascading deletions.
- **Master-Detail Relationships:** Tied custom In-Store Promotional Campaigns to Accounts to enforce roll-up summary reporting on marketing investments.

4. Sales Cloud Pipeline & Guidance

To reduce administrative fatigue, Sales Path was configured with contextual guidance at every deal stage. Sales reps are guided on exactly what data and collateral are needed before advancing grocery deals.

Operational Enforcements

- **5 Tailored Stages:** Discovery → Pitch Presentation → Pricing Proposal → Contract Finalization → Closed Won.
- **Validation Rules:** Blocked reps from advancing to "Contract Finalization" unless wholesale unit margins, store delivery frequencies, and store director approvals were completed.
- **Kanban Drag-and-Drop:** Reps prioritize high-value grocery groups and track monthly pipeline targets in real-time.

5. Process Automation via Flow Builder

Following modern Salesforce best practices, workflow rules and process builders were completely avoided in favor of **three modular Record-Triggered Flows**:

3 Automated Flows Configured

- **Standardized Naming Convention:** Automatically formats Opportunity titles as [Account Name] - [Product SKU] - [Close Quarter] to prevent search chaos.
- **Financial Threshold Notification:** When an opportunity value exceeds \$50,000 in annual volume, an automated notification and chatter alert routes to RevOps executives.
- **Post-Signing Merchandising Task Creation:** Moving a deal to Closed-Won automatically generates onboarding tasks for the field support team with a 5-day due date.

6. Security, Access & Compliance Discipline

Drawing from 5 years of operations leadership at Pakistan's largest commercial bank, enterprise governance standards were incorporated to ensure data privacy, auditability, and least-privilege access.

Enterprise Governance in Practice

"In commercial banking operations, data silos and improper data access directly compromise compliance. For Parker Pizza, the same rigor was applied: standardizing access through Profiles and Permission Sets to ensure sales teams could close deals rapidly without exposing wholesale discount limits or executive margins."

Profiles & Role Hierarchy

- **3 Custom Profiles:** B2B Sales Representative, Marketing Specialist, and RevOps Executive.
- **4 Hierarchical Roles:** Structured reporting paths ensure regional managers automatically inherit record visibility from field territory reps.
- **Organization-Wide Defaults (OWD):** Accounts and Opportunities set to Private, opening access conditionally via sharing rules.

Modular Permission Sets & FLS

- **6 Permission Sets:** Enabled modular capabilities (e.g., Campaign Creation, Discount Approval Overrides) without profile proliferation.
- **Field-Level Security (FLS):** Sensitive financial fields like "Cost of Goods Sold (COGS)" and "Wholesale Margin %" restricted to RevOps leadership.
- **Audit Logging:** Field History Tracking enabled on key contract negotiation fields.

7. RevOps Analytics & Executive Reporting

Over 15 custom tabular, summary, and matrix reports were developed, culminating in a centralized 4-component Executive Dashboard that delivers real-time visibility across the entire distribution footprint.

Key Metrics Monitored

- **Pipeline by Stage:** Immediate identification of bottlenecks in the negotiation and tasting presentation phases.
- **Win/Loss Rate by Grocery Chain:** Actionable feedback on pricing resistance across supermarket segments.
- **Regional Distribution Penetration:** Geographic grouping of active accounts to optimize logistics and delivery routes.
- **Lead Conversion Velocity:** Measurement of average days from first buyer touchpoint to scheduled tasting.

8. Implementation Takeaways & Deliverables

This capstone project validates the end-to-end delivery of an enterprise-aligned Salesforce Sales Cloud org. By combining the structured curriculum of **Salesforce Pathfinder (ReDI School Germany)** with over a decade of real-world operational and regulatory leadership, the implementation delivers:

- **A Scalable B2B Architecture:** Transitioned customer relationship tracking from scattered manual spreadsheets to an integrated Customer 360 platform.
- **Automated Efficiency:** Eliminated manual data entry overhead through Flow automations, allowing field reps to focus on retail buyer relationships.
- **Audit-Ready Governance:** Enforced data cleanliness, validation rules, and role-based permissions ready for enterprise auditing.
